## ABSTRACT

The neuroleptic drug thioridazine has been recently repositioned as possible anti-tubercular drug. Thioridazine showed anti-tubercular activity against drug resistant mycobacteria but it is endowed with adverse side effects. A small library of thioridazine derivatives has been designed through the replacement of the piperidine and phenothiazine moieties, with the aim to improve the anti-tubercular activity and to reduce the cytotoxic effects. Among the resulting compounds, the indole derivative **12e** showed an antimycobacterial activity significantly better than thioridazine and a cytotoxicity 15-fold lower.

## 1. Introduction

According to the recent World Health Organization annual report, tuberculosis (TB) remains one of the deadliest communicable infections [1]. Nearly one third of the worldwide population is latently infected with *Mycobacterium tuberculosis* (MTB), the etiological agent of tuberculosis in humans, and almost 9 million people develop active TB infections per annum. In addition, 14.8% of global TB patients are co-infected with HIV and can be credited as one of the most common causes of death among AIDS patients [2,3]. This global scenario is due to many causes including the lack of rapid diagnostic tools, the non-compliance of hospitalised patients to the 6–12 months multidrug therapy and institutions lacking the proper drug regimens to treat all the people infected [4]. As a consequence of these transgressions, and after half a century of

little to no innovation in the field, MTB have developed multi-drug resistant (MDR) [5–7], extensively-drug resistant (XDR) [8] and totally-drug resistant (TDR) [9] strains, which are resistant to almost all the known available drugs. In 2012, the quinoline derivative bedaquiline [10,11] became the first new drug launched in the market in the last 40 years, since the discovery of rifampin. Currently a number of lead molecules are in clinical trials, such as the diamine SQ109 [12], the fluoroquinolone gatifloxacin [13] and the linezolid [14]. However, the conventional therapeutic approach potentially exacerbates the incidence of new MDR-TB strains and therefore it is inevitable that MTB will evolve resistance against these novel drugs [15,16].

Conventional drug discovery approaches need the identification of a specific target for the development and optimization of a specific molecule. However, it is well known that singular mutations of the targets active site could result in the nullification of drug activity [17]. The current treatment of TB involves the administration of several drugs simultaneously, this reduces the

incidence of resistant MTB strains by avoiding single point mutations resistances against singular treatments. However, several side effects and poor patient compliance are associated with the present multiple therapy. A potentially successful approach to defeat TB is to discover a drug capable of inhibiting multiple MTB targets simultaneously whilst also retaining activity against MDR and latent TB with an ultimate objective of shortening the current TB regimens.

Thioridazine (TZ) **1**, a long established neuroleptic drug, has been recently repositioned as anti-tubercular drug finding application in the treatment of MDR-TB [18,19]. TZ is currently used in therapy as a third line anti-tubercular drug due to the side-effects on the central nervous system and cardiovascular system which restrict its clinical use [20]. Despite the mechanism of action of TZ having not been fully elucidated, recent studies showed that it inhibits efflux pumps in mycobacteria and alters the cell-envelope permeability of MTB [21–23]. Furthermore, TZ **1** is able to affect the physiology of alveolar macrophages, enhancing the retention of potassium ions and promoting the acidification of phagolysosomal vacuole [24], finally leading to the degradation of intramacrophagic MTB.

Despite the chemistry and structure-activity relationship (SAR) properties of TZ, and related neuroleptic drugs, having been widely investigated in the past, to the best of our knowledge no drug derivatization and optimization studies have been carried out on TZ analogues as inhibitors of MTB.

Herein, we report the synthesis, biological evaluation and SAR studies of a narrow library of novel TZ derivatives. In particular, we aimed at the design and identification of novel TZ analogues with improved activity against TB and MDR-TB strains as well as reduced cytotoxic effects. Three series of derivatives were planned in order to explore the chemical space around the TZ nucleus, as shown in Fig. 1. In the first series, the *N*-methyl substituent on the piperidine ring was removed or replaced with different alkyl groups to evaluate its importance for anti-tubercular activity. In the second series, the piperidine ring of TZ was replaced with different aliphatic heterocycles, keeping fixed the distance between the piperidine nitrogen and the phenothiazine ring.

The role of the thiomethyl group attached to the phenothiazine

ring was also investigated in this series. Finally, in the third series the phenothiazine core, which is responsible for the main side effects on the nervous system, was replaced with different hetero-aromatic rings, with the aim to reduce the toxicity of the molecule.

## 2. Results and discussion

### 2.1. Chemistry

A series of *N*-substituted derivatives **4a–c** was first synthesised. TZ was successfully demethylated by treatment with 1-chloro-ethyl-chloroformate in refluxing DCE [25] followed by hydrolysis with MeOH under reflux, leading to derivative **3**. Reductive amination of **3** with different aldehydes/ketones led to the final *N*-alkyl-derivatives **4a–c** in good yields (62–68%). Scheme 1.

A second series of derivatives where the piperidine ring was replaced with different piperazine and thiomorpholine groups was then synthesised (Table 1). In addition, the thio-methyl substituent on the phenothiazine ring was removed or replaced with chlorine, to evaluate its importance for the anti-tubercular activity.

In particular, the chlorine substituent was chosen on the basis of similarity with chlorpromazine, a phenothiazine derivative closely related to TZ whose efflux pumps inhibitory activity is well known. In detail, the phenothiazines **5a–c** were first reacted with 1-bromo-3-chloropropane to yield the chloroderivatives **6a–c** which were in turn treated with different piperazines and with thiomorpholine to yield the desired products **7a–i**. The thio-methyl-phenothiazine **5a** was also reacted with 2-chloroacetyl chloride leading to **8**, which was in turn converted into derivatives **9a–b** by treatment with methylpiperazine or piperidine.

Finally, the third series of compounds bearing the ethyl-

piperidine chain of TZ bound to different aromatic heterocycles was synthesised. **Scheme 2.** 2-(Piperidin-2-yl)ethanol **10** was converted into the Boc-bromoderivative **11** by treatment with (Boc)<sub>2</sub>O followed by reaction with CBr<sub>4</sub>. Different heteroaromatic compounds (namely phenothiazine, 2-Cl-phenothiazine, carbazole, indole, and benzimidazole) were then alkylated with **11** and the resulting intermediates were deprotected with TFA yielding the **12a-e** series of compounds. N-methylation of **12** through reductive amination led to the methyl derivatives **13a-d** [26]. Finally, **16**, bearing an indole nucleus and a piperazine ring as the aliphatic side chain, were synthesised. Indole **14** was converted into the *N*-chloro-propyl derivative **15**, which yielded the final compound **16** after treatment with *N*-methyl-piperazine.

## 2.2. Biological evaluation

All the compounds were initially evaluated for their activity against a panel of non-pathogenic mycobacteria strains (namely, *M. smegmatis* mc<sup>2</sup>155, *M. bovis* BCG and *M. tuberculosis* mc<sup>2</sup>7000, as shown in **Table 2**).

A SAR analysis showed that removal of the methyl group of thioridazine did not affect the activity, the desmethyl-thioridazine **3** showing an activity similar to that of **1**. Also the introduction of a benzyl chain as in **4b** maintained a similar activity. On the other hand, the replacement of the piperidine-ethyl moiety with alkyl chains bearing piperazine or thiomorpholine rings as in **7** and **9** led to a dramatic decrease of antimycobacterial activity, with the only exception of the bulky derivative **7g** which showed a MIC = 4 µg/mL on *M. smegmatis*. Moreover, removal of the methylthio substituent of **1** and **3** (as in **13a** and **12a**), as well as replacement of the

**Scheme 2.** Synthesis of analogues **12**, **13** and **16**. Reagents and conditions: *i.* (Boc)<sub>2</sub>O, Na<sub>2</sub>CO<sub>3(aq)</sub>/DCM, r.t., 12 h; *ii.* PPh<sub>3</sub>, CBr<sub>4</sub>, DCM, r.t., 2 h; *iii.* Heterocycle, NaH, NaI, DMF, r.t., 12 h; *iv.* HCl/EtOAc, r.t., 24 h; *v.* CH<sub>2</sub>O, NaBH(AcO)<sub>3</sub>, THF, AcOH, r.t., 24 h; *vi.* 1-bromo-3-chloropropane, NaH, DMF, r.t., 12 h; *vii.* *N*-methyl-piperazine, Et(*i*Pr)<sub>2</sub>N (DIPEA), NaI, DMF, 150 °C, 3 h.

phenothiazine scaffold with different heterocyclic moieties (as in **13c-d** and **12c-d**) led to a significant loss in activity.

On the contrary, replacement of the same SME group with a chloride group (as in **12b** and **13b**), as well as replacement of the entire phenothiazine moiety with an indole nucleus as in **12e** resulted in compounds with an antimycobacterial activity comparable to or better than that of **1** and **3**. In particular, the chlorophenothiazine derivative **12b** showed a good activity against *M. bovis* BGC and *M. tuberculosis* mc<sup>2</sup>7000 strains with MIC = 5.3 µg/mL and 4 µg/mL, respectively. Similarly, the methylated analogue **13b** retained a 8 µg/mL MIC value. Interestingly, the indole derivative **12e** proved to be highly active against *M. smegmatis* with MIC = 1.6 µg/mL.

The most promising compounds were then assayed against the pathogenic H37Rv strain, the drug-susceptible CF73 clinical isolate, and two MDR-clinical isolates (CF104 and CF81). Also in this case, **12b**, **12e**, and **13b** showed the best results. In particular, the chloro-derivatives **12b** and **13b** had an activity toward the CF73 and the MDR strains similar to that of **1** in the same range of concentrations (8–16 µg/mL). The indole derivative **12e** proved to be the best compound of the series, with an increased activity against both H37Rv and CF73 strains (2.9 and 1 µg/mL, respectively, in

comparison to 10 and 8 µg/mL found for **1**). Moreover, **12e** also showed a similar profile against MDR-CF104 (10 vs 11 µg/mL) and a slightly improved activity against MDR-CF81 (4 vs 10 µg/mL). These data suggest that the presence of a secondary amine on the piperidine side chains could be beneficial for the anti-tubercular activity, as also observed in our previous work [27].

Finally, to prove the effectiveness of the most active compounds, their cytotoxicity was evaluated on MRC-5 and J774 cells. As a result, **12e** showed a selectivity index 15 fold higher than that of TZ on MRC-5 cells (Table 3). In addition, **12e** showed also a good selectivity toward the J774 macrophage cells.

Finally, the effect of TZ derivatives on the efflux pumps of the model surrogate organism *M. smegmatis* was tested in order to understand the mode of action of the new compounds. Efflux pump inhibition (EPI) is determined using a whole-cell-based assay which interrogates the total activity of the diverse sets of efflux pumps present in the cell. The EPI assay showed that some TZ derivatives are endowed with a good efflux pump inhibitory activity. However, there is a weak correlation between inhibition of bacterial growth and efflux pump inhibition. The compounds **12b** and **12e** which showed the most promising antimycobacterial activity proved to be poor efflux pump inhibitors (Fig. 2). These

compounds could interfere with the cell-envelope permeability, as already hypothesized for **1** [23], by means other than inhibiting efflux pumps. On the other hand, the piperazine derivatives **7a** and **7c** which did not show antimycobacterial activity, were found to inhibit efflux pumps better than the reference chlorpromazine. This indicates that these compounds have the potential to reverse multidrug resistance and could be promising candidates for inclusion in a combination therapy regimen owing to synergistic combinations.

**Fig. 2.** Efflux pump inhibition assay. Graphs showing the accumulation of ethidium bromide (EtBr) within *M. smegmatis* cells in the presence of selected compounds and positive (verapamil VP and chlorpromazine CPZ) and negative ( $1 \times \text{PBS}$ ) controls. Low to very high inhibition of efflux (as a representation of an increased level of EtBr accumulation) are shown by relative fluorescent units. The experiments were performed in triplicate ( $n = 3$ ), and the graph is plotted using the average values obtained.

### 3. Conclusions

A classical medicinal chemistry approach has been applied to design and synthesise a narrow library of thioridazine derivatives by structural changes made on three different molecular portions. Antimycobacterial activity of the resulting compounds showed that the piperidine-ethyl side chain is required for inhibit non-pathogenic, pathogenic and MDR mycobacterial strains. Moreover, the SMe-phenothiazine scaffold of **1** could be only replaced with the Cl-phenothiazine analogue or simplified into an indole moiety. The most active compound **12e**, bearing a demethylated piperazine ring in addition to an indole heterocycle, showed an activity profile better than that of **1** and a cytotoxicity about 15-fold lower toward MRC-5 cells.

### 4. Material and methods

#### 4.1. Chemistry. Materials and methods

<sup>1</sup>H NMR and <sup>13</sup>C NMR spectra were recorded on JEOL Delta-270 or JEOL ECS-400 spectrometers operating at the frequencies indicated. Chemical shift ( $\delta$ ) are in ppm, referenced to tetramethylsilane. Coupling constants (J) are reported in hertz and rounded to 0.5 Hz. Splitting patterns are abbreviated as follows: singlet (s), doublet (d), triplet (t), quartet (q), multiplet (m), broad (br) or some combination of them. Infrared spectra were obtained using a Durascope diamond ATR system. Mass spectra (HRMS) were recorded at the EPSRC National Mass Spectrometry Service Centre on a Thermo Scientific LTQ Orbitrap XL mass spectrometer using low-resolution ESI or high-resolution nano ESI techniques. The purity of the compounds was assessed by reverse-phase liquid chromatography coupled with a mass spectrometer (Agilent series 1100 LC/MSD) with a UV detector at  $k = 254$  nm and an electrospray ionization source (ESI). HPLC analyses were performed at 0.4 mL/min flow rate and using a binary solvent system of 95:5 methyl alcohol/water. All the solvents were of HPLC grade. Mass spectra were acquired in positive mode scanning over the mass range of 50–1500. The following ion source parameters were used: drying gas flow, 9 mL/min; nebulize pressure, 40 psig; and drying gas temperature, 350 °C. All target compounds possess a purity of  $\geq 95\%$ , as verified by HPLC analyses. TLC was performed using commercially available precoated plates and visualized with UV light at 254 nm; KMnO<sub>4</sub> was used to reveal the products. Flash column chromatography was carried out using Fluorochem Davisil 40–63  $\mu\text{m}$ , 60 Å. All reactions were conducted under a nitrogen atmosphere in oven-dried glassware unless stated otherwise. THF was distilled under nitrogen from sodium using a benzophenone indicator. Dichloromethane was purchased from Aldrich. All other solvents and commercially available reagents were used as received.

#### 4.1.1. Synthesis of 1-chloroethyl 2-(2-(2-(methylthio)-10h-phenothiazin-10-yl)ethyl)piperidine-1-carboxylate (**2**)

Thioridazine hydrochloride (**1**) (3.87 mmol, 1.57 g, 1 eq.) was dissolved in a round bottomed flask containing dry DCE (20 mL) and Et<sub>3</sub>N (7.74 mmol, 1 mL, 2 eq.). The mixture was stirred at r.t. for 20 min before that 1-chloroethyl chloroformate (7.74 mmol, 0.38 mL, 2 eq.) was added to the solution. The mixture was left under N<sub>2</sub> atmosphere at reflux for 12 h. Then, the reaction mixture was quenched with 10 mL of water and extracted twice with 20 mL of EtOAc. The combined organic layers were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure giving a yellow-brown crude oil. The crude product was purified by chromatography on silica gel, using hexane/EtOAc (4:1) as eluent.

**Yield:** 84% (1.86 g). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>)  $\delta$  7.13–7.01 (m,

2H), 7.01–6.90 (m, 1H), 6.89–6.60 (m, 4H), 6.59–6.29 (m, 1H), 4.20–3.90 (m, 1H), 3.90–3.60 (m, 2H), 2.90–2.74 (m, 1H), 2.74–2.57 (m, 1H), 2.36 (s, 3H), 2.25–2.04 (m, 1H), 1.77–1.60 (m, 3H), 1.58–1.16 (m, 7H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>)  $\delta$  152.9, 145.0, 137.9, 127.8, 127.7, 127.4, 122.8, 121.0, 114.5, 83.4, 49.9, 44.5, 39.8, 29.1, 27.8, 25.4, 19.1, 16.5, 14.3 ppm. **LRMS** *m/z* (ES+) *m/z*: 463 [M+H]<sup>+</sup>

#### 4.1.2. Synthesis of 2-(methylthio)-10-(2-(piperidin-2-yl)ethyl)-10h-phenothiazine (**3**)

Derivative **2** (3.84 mmol, 1.7 g, 1 eq.) was dissolved in MeOH (20 mL) and the solution was stirred at reflux for 12 h then the reaction mixture was concentrated by reduced pressure evaporation. Then, the reaction mixture was quenched with 20 mL of water and extracted twice with 20 mL of EtOAc. The combined organic layers were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure giving a yellow-brown crude oil. The obtained product **3** was purified by chromatography on silica gel, using EtOAc/MeOH/Et<sub>3</sub>N (3.9:1:0.1) as eluent.

**Yield:** 85% (1.1 g). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>)  $\delta$  9.25 (br. s., 1H), 7.20–7.08 (m, 2H), 7.03 (d, *J* = 6.9 Hz, 1H), 6.90 (d, *J* = 7.3 Hz, 2H), 6.82 (m, 2H), 4.13–3.93 (m, 2H), 3.29 (d, *J* = 12.8 Hz, 1H), 3.02 (m, 1H), 2.68 (t, *J* = 12.1 Hz, 1H), 2.46 (s, 3H), 2.18–2.05 (m, 1H), 1.90–1.75 (m, 3H), 1.75–1.53 (m, 3H), 1.44–1.28 (m, 1H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>)  $\delta$  145.9, 144.4, 138.3, 127.8, 127.7, 127.7, 125.9, 123.2, 122.5, 121.2, 116.3, 114.5, 55.7, 44.7, 43.7, 30.7, 28.8, 22.5, 22.2, 16.4 ppm. **LRMS** *m/z* (ES+) *m/z*: 357 [M+H]<sup>+</sup>

#### 4.1.3. General procedure for the synthesis of thioridazine derivatives (**4a-c**)

The 2-(methylthio)-10-(2-(piperidin-2-yl)ethyl)-10h-phenothiazine **3** (0.14 mmol, 50 mg, 1 eq.) was added to a round bottomed flask containing a solution of the appropriate aldehyde/ketone (0.21 mmol, 1.5 eq.) in THF (5 mL). The solution was then allowed to stir at room temperature for 30 min. Then, NaBH(AcO)<sub>3</sub> (0.28 mmol, 60 mg, 2 eq.) was added and the reaction was allowed to react for 24 h at r.t. The reaction was quenched with (20 mL) NaOH 1 N solution and the resulting mixture was allowed to stir for 20 min. Then the organic solvent was removed under reduced pressure evaporation. The residue was added with EtOAc and extracted (3  $\times$  10 mL) and finally dried over anhydrous MgSO<sub>4</sub>. The crude products **4a-c** were purified by chromatography on silica gel, using EtOAc/MeOH/Et<sub>3</sub>N (3.9:1:0.1) as eluent.

4.1.3.1. 10-(2-(1-Benzylpiperidin-2-yl)ethyl)-2-(methylthio)-10h-phenothiazine (**4a**). **Yield:** 67% (42 mg). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>)  $\delta$  7.28–7.17 (m, 5H) 7.14–7.10 (m, 2H), 7.03 (d, *J* = 4.0 Hz, 1H), 6.92–6.84 (m, 2H), 6.81 (d, *J* = 4.0 Hz, 2H), 3.97–3.83 (m, 3H), 3.32 (d, *J* = 8.0 Hz, 1H), 2.75–2.70 (m, 1H), 2.60–2.55 (m, 1H), 2.43 (s, 3H), 2.14 (s, 2H), 2.00–1.94 (m, 1H), 1.77–1.41 (m, 6H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>)  $\delta$  146.0, 145.1, 139.7, 137.6, 129.1, 128.8, 128.6, 128.3, 127.6, 127.6, 127.3, 126.8, 125.4, 122.6, 122.3, 120.9, 115.8, 114.7, 58.4, 57.7, 55.7, 50.6, 44.2, 29.6, 24.4, 23.1, 16.6 ppm. **LRMS** *m/z* (ES+) *m/z*: 447 [M+H]<sup>+</sup>. **HRMS** (ESI) *m/z* calcd. #### 4.1.4. General procedure for the synthesis of compound (6a-c)

The appropriate 2-substituted phenothiazine **5a-c** (0.42 mmol, 1 eq.) was added to 5 mL of DMF in a double neck round bottomed flask. NaH (0.46 mmol, 11 mg, 1.1 eq.) was added to the stirring solution at 0 °C, and the mixture was allowed to reach r.t. stirring for 20 min. Then, 1-bromo-3-chloropropane (0.46 mmol, 45 μL 1.1 eq) was added to the stirring solution. The reaction mixture was allowed to stir under N<sub>2</sub> atmosphere for 12 h at r.t. before being quenched with 10 mL of water and extracted twice with 20 mL of EtOAc. The combined organic layers were washed with brine (10 mL), dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure giving a yellow-brown crude oil. The obtained product was purified by chromatography on silica gel, using hexane/EtOAc (4:1) as eluent.

**4.1.4.1. 10-(3-Chloropropyl)-2-(methylthio)-10H-phenothiazine (6a).** **Yield:** 93% (125 mg). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>) δ 7.18–7.14 (m, 2H), 7.06 (d, *J* = 8.0 Hz, 1H), 6.95–6.88 (m, 2H), 6.84–6.81 (m, 2H), 4.06 (t, *J* = 8.0 Hz, 2H), 3.65 (t, *J* = 8.0 Hz, 2H), 2.46 (s, 3H), 2.22 (t, *J* = 8.0 Hz, 2H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>) δ 145.6, 145.9, 137.8, 127.8, 127.7, 127.5, 125.8, 123.0, 122.7, 121.1, 115.9, 114.6, 44.1, 42.5, 29.7, 16.5 ppm. **LRMS** *m/z* (ES<sup>+</sup>) *m/z*: 322 [M+H]<sup>+</sup>.

**4.1.4.2. 2-Chloro-10-(3-chloropropyl)-10H-phenothiazine (6b).** **Yield:** 84% (109 mg). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>) δ 7.19–7.14 (m, 2H), 7.04 (d, *J* = 8.0 Hz, 1H), 6.95 (t, *J* = 8.0 Hz, 1H), 6.91–6.88 (m, 2H), 6.86 (s, 1H), 4.04 (t, *J* = 8.0 Hz, 2H), 3.65 (t, *J* = 8.0 Hz, 2H), 2.25–2.18 (m, 2H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>) δ 146.5, 144.4, 133.4, 128.2, 127.8, 127.6, 125.5, 124.2, 123.3, 122.7, 116.0, 115.9, 44.1, 42.3, 29.5 ppm. **LRMS** *m/z* (ES<sup>+</sup>) *m/z*: 332 [M+Na]<sup>+</sup>

**4.1.4.3. 10-(3-Chloropropyl)-10H-phenothiazine (6c).** **Yield:** 82% (94 mg). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>) δ 7.19–7.15 (m, 4H), 6.96–6.89 (m, 4H), 4.07 (t, *J* = 8.0 Hz, 2H), 3.66 (t, *J* = 8.0 Hz, 2H), 2.23 (t, *J* = 8.0 Hz, 2H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>) δ 145.2, 127.8, 127.4, 125.8, 122.9, 115.7, 44.0, 42.6, 29.7 ppm. **LRMS** *m/z* (ES<sup>+</sup>) *m/z*: 276 [M+H]<sup>+</sup>

#### 4.1.5. General procedure for the synthesis of thioridazine derivatives (7a-i)

The appropriate chloro-derivative **6a-c** (0.18 mmol, 1 eq.) was dissolved in a round bottomed flask containing dry DMF (10 mL) and Et(iPr)<sub>2</sub>N (DIPEA, 0.19 mmol, 1.1 eq.). The appropriate amine (N-substituted piperazine or thiomorpholine) (0.72 mmol, 4 eq.) was then added to the solution followed by NaI (0.036 mmol, 5 mg, 0.2 eq.). The mixture was left under N<sub>2</sub> atmosphere at 150 °C for 3 h, after which time it was added with water (10 mL) and extracted twice with EtOAc (20 mL). The combined organic layers were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure. The obtained product was purified by chromatography on silica gel, using EtOAc/MeOH/Et<sub>3</sub>N (3.9:1:0.1) as eluent.

**4.1.5.1. 10-(3-(4-Methylpiperazin-1-yl)propyl)-10H-phenothiazine (7a): [28].** **Yield:** 99% (60 mg). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>) δ 7.12 (t, *J* = 8.0 Hz, 4H), 6.90 (t, *J* = 8.0 Hz, 4H), 3.90 (t, *J* = 8.0 Hz, 2H), 2.46 (t, *J* = 8.0 Hz, 2H), 2.42–2.34 (m, 8H), 2.26 (s, 3H), 1.94 (d, *J* = 8.0 Hz, 2H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>) δ 145.2, 127.5, 127.3, 125.1, 122.5, 115.6, 55.7, 55.1, 53.2, 46.0, 45.4, 24.5 ppm. **LRMS** *m/z* (ES<sup>+</sup>) *m/z*: 340 [M+H]<sup>+</sup>.

**4.1.5.9. 2-Chloro-10-(3-thiomorpholinopropyl)-10H-phenothiazine (7i).** **Yield:** 90% (61 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  7.15–7.08 (m, 2H), 6.99 (d,  $J = 8.0$  Hz, 1H), 6.93–6.81 (m, 4H), 3.88 (t,  $J = 8.0$  Hz, 2H), 2.66–2.57 (m, 8H), 2.45 (t,  $J = 8.0$  Hz, 2H), 1.91–1.85 (m, 2H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  146.5, 144.6, 133.2, 127.9, 127.6, 127.5, 124.8, 123.5, 122.9, 122.3, 115.9, 56.0, 55.8, 45.1, 28.1, 24.0 ppm. **LRMS**  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 377  $[\text{M}+\text{H}]^+$ . **HRMS** (ESI)  $m/z$  calcd. for  $\text{C}_{19}\text{H}_{22}\text{ClN}_2\text{S}_2$   $[\text{M}+\text{H}]$  377.0907, found 377.0917.

**4.1.6. 2-Chloro-1-(2-(methylthio)-10H-phenothiazin-10-yl)ethanone (8)**

The phenothiazine **5a** (1.22 mmol, 300 mg, 1 eq.) was dissolved to 15 mL of DMF in a double neck round bottomed flask. NaH (1.83 mmol, 44 mg, 1.5 eq.) was added to the stirring solution at 0 °C, which then was allowed to reach r.t. under stirring for 20 min. Then, 2-chloroacetyl chloride (3.66 mmol, 0.29 mL, 3 eq.) was added and the reaction mixture was stirred under  $\text{N}_2$  atmosphere for 3 h at r.t. The reaction mixture was then quenched with water (10 mL) and extracted twice with EtOAc (20 mL). The combined organic layers were washed with brine, dried over  $\text{Na}_2\text{SO}_4$  and concentrated under reduced pressure giving a yellow-brown crude oil. The obtained product was purified by chromatography on silica gel, using hexane/EtOAc (3:2) as eluent.

**Yield:** 58% (227 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  7.53 (d,  $J = 8.0$  Hz, 1H), 7.47–7.43 (m, 2H), 7.36–7.31 (m, 2H), 7.27–7.23 (m, 1H), 7.14–7.11 (m, 1H), 4.16 (d,  $J = 8.0$  Hz, 2H), 2.49 (s, 3H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  166.3, 138.8, 138.3, 137.5, 128.3, 128.2, 127.7, 127.5, 126.5, 125.7, 124.1, 40.7, 15.9 ppm. **LRMS**  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 322  $[\text{M}+\text{H}]^+$ .

**4.1.7. Synthesis of 2-(4-methylpiperazin-1-yl)-1-(2-(methylthio)-10H-phenothiazin-10-yl)ethanone (9a)**

The 1-methylpiperazine (0.63 mmol, 0.07 mL, 4 eq.) was dissolved in a round bottomed flask containing dry DMF (5 mL) and  $\text{Et}(\text{iPr})_2\text{N}$  (DIPEA, 0.17 mmol, 1.1 eq.). The mixture was stirred at r.t. for 20 min and then 2-chloro-1-(2-(methylthio)-10H-phenothiazin-10-yl)ethanone (**8**) (0.15 mmol, 48 mg, 1 eq.) was added to the solution followed by NaI (0.03 mmol, 4.5 mg, 0.2 eq.). The mixture was left under  $\text{N}_2$  atmosphere at 153 °C for 3 h. Then, the reaction mixture was quenched with water (10 mL) and extracted twice with EtOAc (20 mL). The combined organic layers were washed with brine, dried over  $\text{Na}_2\text{SO}_4$  and concentrated under reduced pressure giving a yellow-brown crude oil. The obtained product was purified by chromatography on silica gel, using EtOAc/MeOH/ $\text{Et}_3\text{N}$  (3.9:1:0.1) as eluent.

**Yield:** 96% (55 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  7.51–7.47 (m, 2H), 7.41 (d,  $J = 8.0$  Hz, 1H), 7.32–7.26 (m, 2H), 7.22–7.18 (m, 1H), 7.10–7.08 (m, 1H), 3.30–3.31 (m, 2H), 2.47 (s, 3H), 2.44–2.27 (8H), 2.22 (s, 3H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  168.6, 139.3, 138.6, 137.9, 128.0, 127.9, 127.0, 126.9, 125.1, 124.9, 60.4, 54.9, 52.9, 45.9, 16.2 ppm. **LRMS**  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 386  $[\text{M}+\text{H}]^+$ . **HRMS** (ESI)  $m/z$  calcd. for  $\text{C}_{20}\text{H}_{24}\text{N}_3\text{S}_2\text{O}$   $[\text{M}+\text{H}]$ , 386.1355 found 386.1351.

**4.1.8. Synthesis of 1-(2-(methylthio)-10H-phenothiazin-10-yl)-2-(piperidin-1-yl)ethanone (9b)**

Piperidine (1.22 mmol, 0.12 mL, 4 eq.) was added to a round bottomed flask containing DMF (5 mL) and  $\text{Et}(\text{iPr})_2\text{N}$  (DIPEA, 0.31 mmol, 1 eq.) and the mixture was allowed to stir at room temperature for 30 min before 2-chloro-1-(2-(methylthio)-10H-phenothiazin-10-yl)ethanone (**8**) (0.31 mmol, 98 mg, 1 eq.) was added to the solution. The reaction was allowed to stir for 3 h at 150 °C. The reaction mixture was then quenched with water (10 mL) and extracted twice with EtOAc (20 mL). The combined organic layers were washed with brine, dried over  $\text{Na}_2\text{SO}_4$  and concentrated under reduced pressure giving a yellow-brown crude oil. The obtained product was purified by chromatography on silica gel, using EtOAc/MeOH/ $\text{Et}_3\text{N}$  (3.9:1:0.1) as eluent.

**Yield:** 91% (104 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  7.51–7.47 (m, 2H), 7.40 (d,  $J = 8.0$  Hz, 1H), 7.30–7.24 (m, 1H), 7.19 (t,  $J = 8.0$  Hz, 1H), 7.08 (d,  $J = 12.0$  Hz, 2H), 3.24–3.23 (d,  $J = 8.0$  Hz, 2H), 2.47 (s, 3H), 2.35 (m, 4H), 1.46–1.41 (m, 4H), 1.32–1.29 (m, 2H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  163.7, 138.9, 135.8, 135.7, 132.3, 132.2, 126.7, 126.7, 122.2, 118.0, 116.2, 56.8, 56.1, 25.2, 24.2, 16.0 ppm. **LRMS**  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 371  $[\text{M}+\text{H}]^+$

**4.1.9. Synthesis of *t*-butyl 2-(2-bromoethyl)piperidine-1-carboxylate (11)**

The 2-(piperidin-2-yl)ethanol **10** (1.55 mmol, 200 mg, 1 eq.) was added to 10 mL mixture (1:1) of  $\text{CH}_2\text{Cl}_2$  and  $\text{Na}_2\text{CO}_3$  aqueous solution (10 mL total) in a round bottomed flask. Di-*t*-butyl dicarbonate (1.70 mmol, 371 mg, 1.1 eq.) was added to the stirring solution. The reaction mixture was stirred for 24 h at room temperature. Then, the reaction mixture was diluted with 10 mL of water and extracted once with 10 mL of  $\text{CH}_2\text{Cl}_2$  and twice with 20 mL of EtOAc. The combined organic layers were washed with brine, dried over  $\text{Na}_2\text{SO}_4$  and concentrated under reduced pressure giving a yellow crude oil. The crude product was purified by chromatography on silica gel, using hexane/EtOAc (3:2) as eluent affording the *N*-Boc-protected amino alcohol. **Yield:** 98% (314 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  4.35–4.19 (m, 1H), 3.85–3.80 (m, 2H), 3.48–3.42 (m, 1H), 3.27 (br s, 1H), 2.59–2.52 (m, 1H), 1.81 (t,  $J = 12.0$  Hz, 1H), 1.64–1.54 (m, 1H), 1.51–1.37 (m, 5H), 1.37 (s, 9H), 1.29–1.25 (m, 1H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  155.0, 80.2, 58.7, 46.1, 39.4, 32.5, 28.5, 28.4, 25.6, 19.0 ppm. **LRMS**  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 230  $[\text{M}+\text{Na}]^+$

To a solution of the above synthesised *N*-Boc-amino alcohol (0.43 mmol, 89 mg, 1 eq.) in  $\text{CH}_2\text{Cl}_2$  (10 mL) was added  $\text{PPh}_3$  (0.47 mmol, 123 mg, 1.1 eq.) followed by a solution of  $\text{CBr}_4$  (0.47 mmol, 156 mg, 1.1 eq.) in 20 mL of  $\text{CH}_2\text{Cl}_2$  at r.t. and the mixture was allowed to stir for 45 min. Then, the reaction mixture was concentrated under reduced pressure giving a yellow crude oil. The obtained product was then immediately purified by chromatography on silica gel, using hexane/EtOAc (9:1) as eluent. The pure product **11** was obtained as a yellow oil. **Yield:** 79% (99 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  4.35–4.31 (m, 1H), 4.02–3.84 (m, 1H), 3.33–3.19 (m, 2H), 2.70–2.64 (t,  $J = 12.0$  Hz, 1H), 2.33–2.23 (m, 1H), 1.90–1.64 (m, 1H), 1.63–1.43 (m, 5H), 1.40 (s, 9H), 1.38–1.31 (m, 1H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  155.2, 79.6, 49.5, 38.7, 33.6, 30.3, 28.7, 28.5, 25.5, 19.2 ppm. **LRMS**  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 293  $[\text{M}+\text{H}]^+$

#### 4.1.10. General procedure for the synthesis of Boc-protected thioridazine derivatives (**S12a-e**)

The appropriate 2-substituted phenothiazine (**5a-c**) or carbazole, indole, or benzimidazole (0.42 mmol, 1 eq.) was added to 10 mL of DMF in a double neck round bottomed flask. NaH (0.52 mmol, 12.5 mg, 1.2 eq.) was added to the stirring solution at 0 °C, which then was allowed to reach r.t stirring for 20 min. Then, *t*-butyl 2-(2-bromoethyl)piperidine-1-carboxylate (**11**) (0.52 mmol, 152 mg, 1.2 eq.) and NaI (0.02 mmol, 3 mg, 0.1 eq) were added to the stirring solution. The reaction mixture was allowed to stir under N<sub>2</sub> atmosphere for 12 h at r.t. Then, the reaction mixture was quenched with 20 mL of water and extracted twice with 20 mL of EtOAc. The combined organic layers were washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure giving a yellow-brown crude oil. The crude product was purified by chromatography on silica gel, using hexane/EtOAc (4:1) as eluent.

**4.1.10.1. *t*-Butyl 2-(2-(10H-phenothiazin-10-yl)ethyl)piperidine-1-carboxylate (**S12a**). Yield:** 45% (77 mg). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>) δ 7.16–7.12 (m, 4H), 6.93–6.89 (m, 2H), 6.84 (d, *J* = 8.0 Hz, 2H), 4.45–4.35 (m, 1H), 4.08–3.96 (m, 1H), 3.92–3.74 (m, 2H), 3.38–3.28 (m, 1H), 2.83–2.69 (m, 1H), 2.37–2.18 (m, 1H), 1.91–1.85 (m, 1H), 1.67–1.49 (m, 5H), 1.40 (s, 9H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>) δ 155.1, 145.3, 127.6, 127.3, 125.1, 122.5, 115.3, 79.4, 49.5, 38.7, 33.6, 30.3, 28.7, 28.5, 25.5, 19.2 ppm. **LRMS *m/z* (ES<sup>+</sup>) *m/z*:** 411 [M+H]<sup>+</sup>

#### 4.1.11. General procedure for the synthesis of thioridazine derivatives (**12a-e**)

The appropriate Boc-protected compound (**S12a-e**) (0.24 mmol, 1 eq.) was added to a round bottom flask containing 5 mL HCl saturated solution in EtOAc. The reaction mixture was allowed to stir at room temperature for 24 h. The solvent was removed under reduced pressure giving a white solid as product of the reaction. The solid products **12a-e** were washed several times with cold Et<sub>2</sub>O.

**4.1.11.1. 10-(2-(piperidin-2-yl)ethyl)-10H-phenothiazine (**12a**). Yield:** 99% (73 mg). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>) δ 9.41 (br. s., 1H), 9.24 (br. s., 1H), 7.15–7.12 (m, 4H), 6.92–6.86 (m, 4H), 3.97–3.92 (m, 2H), 3.49–3.45 (m, 1H), 3.08–3.05 (m, 1H), 2.73–2.57 (m, 1H), 2.45–2.43 (m, 1H), 2.18–2.06 (m, 1H), 1.93–1.74 (m, 3H), 1.69–1.60 (m, 2H), 1.44–1.34 (m, 1H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>) δ 145.3, 127.7, 127.4, 125.4, 122.7, 115.6, 55.6, 46.8, 44.3, 33.7, 32.4, 25.9, 24.5 ppm. **LRMS *m/z* (ES<sup>+</sup>) *m/z*:** 311 [M+H]<sup>+</sup>. **HRMS (ESI) *m/z* calcd.** for C<sub>19</sub>H<sub>22</sub>N<sub>2</sub>S [M + H] 311.1576, found 311.1579.

**4.1.11.2. Synthesis of 2-chloro-10-(2-(piperidin-2-yl)ethyl)-10H-phenothiazine (**12b**). Yield:** 94% (77 mg). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>) δ 9.54 (br s, 1H), 9.34 (br s, 1H), 7.19 (t, *J* = 8.0 Hz 1H), 7.13 (d, *J* = 8.0 Hz, 1H), 7.04 (d, *J* = 8.0 Hz, 1H), 6.95–6.89 (m, 4H), 4.07–3.96 (m, 2H), 3.31 (d, *J* = 8.0 Hz, 1H), 3.12–3.04 (m, 1H), 2.77–2.68 (m, 1H), 2.50–2.42 (m, 1H), 2.13–2.09 (m, 1H), 1.85–1.69 (m, 6H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>) δ 146.6, 144.5, 133.3, 128.0, 127.6, 127.5, 125.1, 123.9, 123.1, 122.5, 115.9, 55.4, 46.7, 44.4, 33.5, 29.7, 25.8, 24.4 ppm. **LRMS *m/z* (ES<sup>+</sup>) *m/z*:** 345 [M+H]<sup>+</sup>. **HRMS (ESI) *m/z* calcd.** for C<sub>19</sub>H<sub>21</sub>ClN<sub>2</sub>S [M + H] 345.1187, found 345.1194.

**4.1.11.3. Synthesis of 9-(2-(piperidin-2-yl)ethyl)-9H-carbazole (**12c**). Yield:** 95% (63 mg). **<sup>1</sup>H NMR** (400 MHz CDCl<sub>3</sub>) δ 9.66 (br s, 1H), 9.41 (br s, 1H), 8.02 (d, *J* = 8.0, 2H), 7.46–7.37 (m, 4H), 7.17 (t, *J* = 8.0, 2H), 4.51–4.43 (m, 1H), 4.31–4.25 (m, 1H), 3.38–3.36 (m, 1H), 3.02–2.90 (m, 1H), 2.70–2.67 (m, 1H), 2.49–2.48 (m, 1H), 2.18–2.12 (m, 1H), 1.88–1.61 (m, 6H) ppm. **<sup>13</sup>C NMR** (100 MHz CDCl<sub>3</sub>) δ 140.0, 126.1, 122.9, 120.4, 119.3, 108.8, 55.5, 44.9, 39.5, 32.7, 30.0, 22.3, 22.0 ppm. **LRMS *m/z* (ES<sup>+</sup>) *m/z*:** 279 [M+H]<sup>+</sup>. **HRMS (ESI) *m/z* calcd.** for C<sub>19</sub>H<sub>22</sub>N<sub>2</sub> [M + H] 279.1856, found 279.1855.

#### 4.1.12. General procedure for the synthesis of thioridazine derivatives (**13a-d**)

Compounds (**12a-d**) (0.14 mmol, 1 eq.) were added to a round bottom flask containing THF (5 mL) and formaldehyde aqueous solution 37% w/v (0.28 mmol, 2 eq.). The solution was then allowed

to stir at room temperature for 30 min. Then,  $\text{NaBH}(\text{AcO})_3$  (0.28 mmol, 59 mg, 2.0 eq.) was added. The reaction was then stirred for 24 h at r.t. after which time the solution was quenched with (20 mL)  $\text{NaOH}$  1 N aqueous solution. The resulting mixture was stirred for further 20 min and then the organic solvent was removed through reduced pressure evaporation. The residue was diluted with  $\text{EtOAc}$ , extracted twice with  $\text{EtOAc}$  (10 mL) and dried over anhydrous  $\text{MgSO}_4$ . The solvent was concentrated under reduced pressure and the obtained product was purified by chromatography on silica gel, using  $\text{EtOAc}/\text{MeOH}/\text{Et}_3\text{N}$  (3.9:1:0.1) as eluent.

**4.1.12.1. 10-(2-(1-Methylpiperidin-2-yl)ethyl)-10H-phenothiazine (13a).** Yield: 47% (21.3 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  7.19–7.07 (m, 4H), 6.95–6.85 (m, 4H), 3.95 (ddd,  $J = 13.9, 8.6, 5.5$  Hz, 1H), 3.89–3.77 (m, 1H), 2.89–2.72 (m, 1H), 2.22–2.16 (m, 3H), 2.16–1.99 (m, 3H), 1.93–1.80 (m, 1H), 1.71 (d,  $J = 10.1$  Hz, 1H), 1.64–1.50 (m, 2H), 1.34–1.18 (m, 3H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  145.4, 127.6, 127.3, 125.4, 122.5, 115.6, 62.2, 57.0, 43.9, 43.1, 30.8, 30.0, 25.7, 24.2 ppm. LRMS  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 325 [ $\text{M}+\text{H}$ ] $^+$ . HRMS (ESI)  $m/z$  calcd. for  $\text{C}_{20}\text{H}_{25}\text{N}_2\text{S}$  [ $\text{M}+\text{H}$ ] 325.1733, found 325.1735.

**4.1.12.2. 2-Chloro-10-(2-(1-methylpiperidin-2-yl)ethyl)-10H-phenothiazine (13b).** Yield: 38% (19 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  7.11–7.02 (m, 2H), 6.94 (d,  $J = 8.3$  Hz, 1H), 6.85 (t,  $J = 7.4$  Hz, 1H), 6.82–6.73 (m, 3H), 3.91–3.78 (m, 1H), 3.78–3.63 (m, 1H), 2.85–2.68 (m, 1H), 2.14 (s, 3H), 2.07–1.95 (m, 3H), 1.85–1.72 (m, 1H), 1.69–1.58 (m, 2H), 1.56–1.46 (m, 2H), 1.28–1.11 (m, 2H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  147.5, 145.2, 133.8, 128.4, 128.1, 127.8, 126.0, 125.1, 123.6, 122.8, 116.8, 116.5, 62.5, 57.1, 44.4, 42.3, 30.9, 29.7, 25.6, 24.1 ppm. LRMS  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 359 [ $\text{M}+\text{H}$ ] $^+$ . HRMS (ESI)  $m/z$  calcd. for  $\text{C}_{20}\text{H}_{24}\text{ClN}_2\text{S}$  [ $\text{M}+\text{H}$ ] 359.1343, found 359.1347.

**4.1.12.3. 9-(2-(1-Methylpiperidin-2-yl)ethyl)-9H-carbazole (13c).** Yield: 67% (27 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  8.10 (d,  $J = 7.3$  Hz, 2H), 7.52–7.32 (m, 4H), 7.29–7.06 (m, 2H), 4.52–4.38 (m, 1H), 4.38–4.22 (m, 1H), 2.97–2.82 (m, 1H), 2.33 (s, 3H), 2.17–2.06 (m, 2H), 2.06–1.94 (m, 2H), 1.79 (d,  $J = 11.9$  Hz, 2H), 1.67–1.60 (m, 2H), 1.40–1.27 (m, 2H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  140.2, 125.7, 123.0, 120.5, 118.8, 108.6, 61.7, 57.0, 43.0, 39.2, 31.5, 30.7, 25.6, 24.4 ppm. LRMS  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 293 [ $\text{M}+\text{H}$ ] $^+$ . HRMS (ESI)  $m/z$  calcd. for  $\text{C}_{20}\text{H}_{24}\text{N}_2$  [ $\text{M}+\text{H}$ ], 293.2012 found 293.2014.

**4.1.12.4. 1-(2-(1-Methylpiperidin-2-yl)ethyl)-1H-benzo[d]imidazole (13d).** Yield: 70% (29 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CD}_3\text{OD}$ )  $\delta$  8.86 (s, 1H), 8.33–8.22 (m, 2H), 7.99–7.90 (m, 2H), 5.03–4.95 (m, 2H), 3.55–3.50 (m, 1H), 2.90 (s, 3H), 2.70–2.42 (m, 4H), 2.28–2.24 (m, 2H), 2.00–1.80 (m, 4H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CD}_3\text{OD}$ )  $\delta$  144.0, 143.3, 134.0, 123.7, 122.9, 119.6, 110.7, 62.2, 57.1, 42.1, 32.8, 30.6, 30.1, 25.4, 24.1 ppm. LRMS  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 244 [ $\text{M}+\text{H}$ ] $^+$ . HRMS (ESI)  $m/z$  calcd. for  $\text{C}_{15}\text{H}_{22}\text{N}_3$  [ $\text{M}+\text{H}$ ] 244.1808, found 244.1811.

#### 4.1.13. Synthesis of 1-(3-chloropropyl)-1H-indole (15)

Indole (0.52 mmol, 0.052 mL, 1 eq.) was added to 10 mL of DMF in a double neck round bottomed flask.  $\text{NaH}$  (0.57 mmol, 14 mg, 1.1 eq.) was added to the stirring solution at 0 °C, and the mixture was allowed to reach r.t. stirring for 20 min. Then, 1-bromo-3-chloropropane (0.57 mmol, 90 mg, 1.1 eq.) was added. The reaction mixture was allowed to stir under  $\text{N}_2$  atmosphere for 12 h at r.t. The reaction was quenched with water (10 mL) and extracted twice with  $\text{EtOAc}$  (20 mL). The combined organic layers were washed with brine, dried over  $\text{Na}_2\text{SO}_4$  and concentrated under reduced pressure giving a yellow-brown crude oil. The crude product (15) was purified by chromatography on silica gel, using hexane/ $\text{EtOAc}$  (4:1) as eluent. Yield: 82% (82 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  7.69

(d,  $J = 8.0$  Hz, 1H), 7.41 (d,  $J = 8.0$  Hz, 1H), 7.27 (t,  $J = 8.0$  Hz, 1H), 7.19–7.15 (m, 2H), 6.56 (d,  $J = 4.0$  Hz, 1H), 4.37–4.33 (m, 2H), 3.46 (t,  $J = 8.0$  Hz, 1H), 3.32 (t,  $J = 8.0$  Hz, 1H), 2.37–2.26 (m, 2H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  135.9, 128.8, 128.1, 121.8, 121.2, 119.6, 109.4, 101.6, 42.9, 42.0, 32.7 ppm. LRMS  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 194 [ $\text{M}+\text{H}$ ] $^+$

#### 4.1.14. Synthesis of 1-(3-(4-methylpiperazin-1-yl)propyl)-1H-indole (16)

The derivative 16 was synthesised following the procedure used for the synthesis of compounds 7a-i. Yield: 63% (30 mg).  $^1\text{H NMR}$  (400 MHz  $\text{CDCl}_3$ )  $\delta$  7.51–7.47 (m, 2H), 7.40 (d,  $J = 8.0$  Hz, 1H), 7.30–7.24 (m, 1H), 7.19 (t,  $J = 8.0$  Hz, 1H), 7.08 (d,  $J = 12.0$  Hz, 2H), 3.24–3.23 (d,  $J = 8.0$  Hz, 2H), 2.47 (s, 3H), 2.35 (m, 4H), 1.46–1.41 (m, 4H), 1.32–1.29 (m, 2H) ppm.  $^{13}\text{C NMR}$  (100 MHz  $\text{CDCl}_3$ )  $\delta$  163.7, 138.9, 135.8, 135.7, 132.3, 132.2, 126.7, 126.7, 122.2, 118.0, 116.2, 56.8, 56.1, 25.2, 24.2, 16.0 ppm. LRMS  $m/z$  ( $\text{ES}^+$ )  $m/z$ : 258 [ $\text{M}+\text{H}$ ] $^+$ . HRMS (ESI)  $m/z$  calcd. for  $\text{C}_{16}\text{H}_{24}\text{N}_3$  [ $\text{M}+\text{H}$ ] 258.1965, found 258.1966.

## 4.2. Biology

**Bacterial strains and growth conditions:** The bacterial species used in this study were *M. smegmatis* mc2155 (ATCC 700084), *M. bovis* BCG Pasteur (ATCC 35734), *M. tuberculosis* mc27000, *M. tuberculosis* H37Rv (ATTC27294), *M. tuberculosis* CF73 and two MDR-TB clinical isolates (CF104 and CF81) obtained from Clemente Ferreira Hospital, São Paulo, Brazil [29]. Mycobacterial species were cultured in either Middlebrook 7H9 broth or Middlebrook 7H10 agar media supplemented with albumin-dextrose-catalase (ADC) or oleic acid-albumin-dextrose-catalase (OADC) enrichments, respectively, purchased from BD Biosciences. All reagents were purchased from Sigma-Aldrich unless stated otherwise.

#### 4.2.1. Bacterial growth inhibition assays

The MIC of the compounds against *M. smegmatis* mc2155, *M. bovis* BCG, and *M. tuberculosis* mc27000 were calculated by standard MABA (Microplate Alamar Blue assay) as previously described [27]. Briefly, 200  $\mu\text{L}$  of sterile deionized water was added to all outer-perimeter wells of a sterile 96-well plate (Corning Incorporated, Corning, NY) to minimize evaporation of the medium in the test wells during incubation. The wells in rows B to G in columns 3 to 11 received 100  $\mu\text{L}$  of 7H9 medium containing 0.2% casamino acids, 24  $\mu\text{g}/\text{mL}$  pantothenate and 10% OADC (Beckton Dickinson, Sparks, MD). Compounds were added to rows B–G followed by 1:2 serial dilutions across the plate to column 10, and 100  $\mu\text{L}$  of excess medium was discarded from the wells in column 10. The bacterial culture at 0.5 McFarland standard diluted 1:50 (100  $\mu\text{L}$ ) was added to the wells in rows B to G in columns 2 to 11, where the wells in column 11 served as drug-free controls. The plates were sealed with parafilm<sup>TM</sup> and were incubated at 37 °C. A freshly prepared 1:1 mixture of Alamar Blue (Celltiter-Blue<sup>TM</sup>, Promega Corp, Madison, WI) reagent and 10% Tween<sup>®</sup> 80 (50  $\mu\text{L}$ ) and re-incubated at 37 °C for 24 h.

#### 4.2.2. Determination of minimal inhibitory concentration (MIC<sub>90</sub>)

The anti-*M. tuberculosis* activity of the compounds against *M. tuberculosis* H37Rv (ATTC27294), *M. tuberculosis* CF73 and two MDR-TB clinical isolates (CF104 and CF81) was determined using the Resazurin Microtiter Assay (REMA) method according to Palomino et al., [30]. Stock solutions of the tested compounds were prepared in dimethyl sulfoxide (DMSO), then diluted in Middlebrook 7H9 broth (Difco, Detroit, MI, USA) supplemented with oleic acid, albumin, dextrose and catalase (OADC enrichment) to obtain a final drug concentration range of 0.09–100  $\mu\text{g}/\text{mL}$ . A suspension of the *M. tuberculosis* H37Rv ATCC 27294 and clinical isolates were cultured in Middlebrook 7H9 broth supplemented with

OADC and 0.05% Tween 80 for one week at 37 °C in an atmosphere of 5% CO<sub>2</sub>. The concentration was adjusted at McFarland 1 and diluted to  $2.4 \times 10^5$  CFU/mL. 100 µL of the inoculum was added to each well of a 96-well microplate together with 100 µL of the compounds. The plate was incubated for 7 days at 37 °C in an atmosphere of 5% CO<sub>2</sub>. After 24 h, 30 µL 0.01% resazurin (solubilized in water) was added. The fluorescence of the wells was read after 24 h using a Cytation 3 (BioTek®, Winooski, VT, USA). The MIC<sub>90</sub> was defined as the lowest concentration resulting in 90% inhibition of growth of *M. tuberculosis*. Samples were set up in three independent assays.

#### 4.2.3. Cytotoxic analysis (IC<sub>50</sub>) of MRC-5 cell line

In these experiment, cells were collected in a solution of trypsin/ethylenediamine tetracetic acid (EDTA) (Vitrocell®) and centrifuged ( $252 \times g$  for 5 min). The number of cells was counted using a Neubauer chamber (Celeromics, Valencia, Spain) after staining non-viable cells with 0.4% trypan blue solution (Sigma-Aldrich®) via the cell exclusion assay. Then, the cell concentration was adjusted to  $7.5 \times 10^4$  cells/mL in DMEM for tumor cells and MRC-5 cells (ATCC CCL-171). Next, a 200 µL suspension was deposited into each well of a 96-well microplate to a cell density of  $1.5 \times 10^4$  cells/well. The cells were incubated at 37 °C in an atmosphere of 5% CO<sub>2</sub> for 24 h to allow the cells to attach to the plate [31]. The compounds were solubilized in DMSO to an initial concentration of 10,000 µg/mL. Test solutions of the compounds were prepared to obtain concentrations from 500 to 1.95 µg/mL. The diluted solutions were added to the cells after changing the medium to remove any non-adherent cells, and the cultures were incubated for an additional 24 h. The cytotoxicity of the compounds was determined after incubating the cells in 30 µL of resazurin for approximately 2 h. The measurement was performed using a Synergy H1 microplate reader (BioTek®, Winooski, VT, USA) with excitation and emission filters at wavelengths of 530 and 590 nm, respectively. The assays were performed in three independent experiments.

#### 4.2.4. Cytotoxicity assay (IC<sub>50</sub>) of J774 cell line

In vitro cytotoxicity assays (IC<sub>50</sub>) were performed on the J774 cell line, as previously reported [32]. The cells were routinely maintained in Complete Medium (RPMI-1640 supplemented with 10% heat-inactivated fetal bovine serum (FBS); 100 U/mL penicillin and 100 µg/mL streptomycin), at 37 °C, in a humidified 5% CO<sub>2</sub> atmosphere. After reaching confluence, the cells were detached and counted. For the cytotoxicity assay,  $1 \times 10^5$  cells/mL were seeded in 200 µL of Complete Medium in 96-well plates (NUNC). The plates were incubated at 37 °C under a 5% CO<sub>2</sub> atmosphere for 24 h, to allow cell adhesion prior to drug testing. The compounds were dissolved in DMSO and subjected to two-fold serial dilution from 1250 to 3.9 µg/mL. Cells were exposed to the compounds at various concentrations for a 24 h-period. Resazurin solution was then added to the cell cultures and incubated for 6 h. Cell respiration, as an indicator of cell viability, was detected by reduction of resazurin to resorufin, whose pink colour and fluorescence indicates cell viability. A persistent blue colour of resazurin is a sign of cell death. The fluorescence measurements (530 nm excitation filter and 590 nm emission filter) were performed in a SPECTRAfluor Plus (Tecan) microfluorimeter. The IC<sub>50</sub> value was defined as the highest drug concentration at which 50% of the cells are viable relative to the control.

#### 4.2.5. Efflux pump inhibition assays

The assay was performed based on previously published protocols [27]. In brief, early log phase cells of *M. smegmatis* were taken and the OD<sub>600</sub> was adjusted to 0.4 in  $1 \times$  PBS. The test samples

contained  $(4-6) \times 10^7$  bacteria/mL in PBS, 0.4% glucose (as a source of energy for efflux pumps activity), 0.5 mg/L ethidium bromide (as a substrate for efflux pumps), and the compounds being tested at  $1/4 \times$  MIC concentrations. Blank samples contained all of the components mentioned above, except the bacterial suspension, which was replaced with  $1 \times$  PBS. Verapamil and chlorpromazine, known efflux pump inhibitors, were used as positive controls at concentrations of 125 µg/mL and 10 µg/mL respectively. The experiment was performed in a 96-well plates that was read in a fluorimeter (FLUOstar OPTIMA, BMG Labtech) with the following parameters: wavelengths of 544 and 590 nm for excitation and detection of fluorescence, gain 2200, a temperature of 37 °C, and a cycle of measurement every minute for a total period of 60 min. The accumulation or efflux of ethidium bromide was monitored in real-time for the mentioned period.
