Dois novos metabólitos, 2,4-diidroxi-5,6-dimetil benzoato de etila (1) e phomopsilactona (2) foram isolados de *Phomopsis cassiae*, um fungo endofítico de *Cassia spectabilis*. As estruturas destes compostos foram elucidadas por dados espectrométricos de 1D e 2D RMN, EM e IV. As substâncias 1 e 2 exibiram forte atividade antifúngica contra os fungos fitopatogênicos *Cladosporium cladosporioides* e *C. sphaerospermum*, bem como citotoxicidade contra a linhagem celular de tumor cervical humano (HeLa), em experimentos *in vitro*.

Two new metabolites, ethyl 2,4-dihydroxy-5,6-dimethylbenzoate (1) and phomopsilactone (2) were isolated from *Phomopsis cassiae*, an endophytic fungus in *Cassia spectabilis*. Their structures were elucidated by 1D and 2D NMR, MS and IR spectral data. Compounds 1 and 2 displayed strong antifungal activity against the phytopathogenic fungi *Cladosporium cladosporioides* and *C. sphaerospermum*, as well as cytotoxicity against human cervical tumor cell line (HeLa), in *in vitro* assays.

**Keywords:** endophytic fungi, *Phomopsis cassiae*, *Cassia spectabilis*, cytotoxic metabolites, antifungal activity

**Introduction**

The genus Cassia, comprising about 600 species widely distributed worldwide, is well known for its diverse biological and pharmacological properties.  *Cassia spectabilis* (sin *Senna spectabilis*) (DC) Irwin et Barn (Leguminosae) has been used in traditional Brazilian medicine for the treatment of flu and cold, as laxative and purgative. This observation prompted us to launch a program aiming to search novel bioactive metabolites from cultures of endophytes colonized inside *C. spectabilis*. Leaves of *C. spectabilis* were submitted to isolation of endophytic fungi and seven isolates were obtained, preserved and cultivated on liquid medium to get their crude extracts. The strain *Phomopsis cassiae* was selected for chemical and biological investigation because of the strong antifungal activity against the phytopathogenic fungi *Cladosporium sphaerospermum* and *C. cladosporioides*.

Fractionation of the crude EtOAc extract by flash chromatography column on reversed-phase C-18 silica, followed by reversed-phase HPLC, afforded compounds 1-2 and 2-hydroxyphenylacetic acid (3). The structures of the new metabolites, ethyl 2,4-dihydroxy-5,6-dimethyl benzoate (1) and phomopsilactone (2) were determined by analysis of NMR and MS data.

**Results and Discussion**

Compound 1 was isolated as a white amorphous solid and its molecular formula C_{11}H_{14}O_{4} was deduced from ¹H NMR and ESI-MS data [(M + H)⁺] at *m/z* 211. This formula displayed five degrees of unsaturation. The ¹H, ¹³C NMR
Table 1. $^1$H and $^{13}$C NMR (500 and 125 MHz, $\delta$ value, $J$ in Hz) spectral data and gHMBC correlations of 1a and 2b

*in CD$_3$OD, **in DMSO-$d_6$
C. sphaerospermum was evaluated by bioautography\textsuperscript{11,12} and the detection limit for the compounds 1 and 2 was 1.0 μg, the same as for the positive control nystatin.

Cytotoxicity of the compounds 1, 2 and 3 against human cervical tumor cell line (HeLa) were tested using the MTT assay.\textsuperscript{13} Compound 2 exhibited weak cytotoxicity (IC\textsubscript{50} 200 μmol L\textsuperscript{-1}) and 3 a strong cytotoxicity (IC\textsubscript{50} 10 μmol L\textsuperscript{-1}). Cisplatin, a cytotoxic agent, was used as positive control with IC\textsubscript{50} 5 μmol L\textsuperscript{-1}.

**Experimental**

**Instrumental and chromatography materials**

Optical rotations were measured in MeOH using a Perkin Elmer polarimeter with a sodium lamp at 598 nm and 25°C. IR spectra were recorded on a Perkin Elmer-FT-IR, using KBr pellets. The NMR spectra were recorded in CD\textsubscript{3}OD and DMSO-\textit{d}\textsubscript{6}, on a Varian Unit 500 spectrometer at 500 and 125 MHz. Mass spectra ESI-MS were obtained on a Fisons Platform VG mass spectrometer at 20 eV. For HRESIMS a Q-TOF Autospec-Micromass equipment was used. Column chromatography (CC) was performed over reversed-phase silica gel 230-400 mesh (Merck). TLC was performed using silica gel 60 (>230 mesh) and precoated silica gel 60 PF\textsubscript{254} (Merck). Spots on TLC were visualized under UV light and by spraying with anisaldehyde-H\textsubscript{2}SO\textsubscript{4} reagent, followed by heating at 120 °C. Analytical HPLC was performed on a Varian Pro Star 230 using a Phenomenex C-18 column (250 mm x 4.6 mm). Preparative HPLC was performed on a Varian Prep-Star 400 system using a Phenomenex C-18 (250 mm x 21.20 mm) preparative column.

**Plant material**

The leaves of Cassia spectabilis were collected in June 2001 in Araraquara City. The botanical identification was made by Professor Maria Cláudia Marx Young and a voucher specimen (SILVA-193) has been deposited in the Herbarium of the Instituto de Botânica de São Paulo, Brazil.

**Fungal isolation**

Phomopsis cassiae was isolated from healthy leaves of Cassia spectabilis as previously reported.\textsuperscript{14,15} The fungus was identified by Dr. Ludwig H. Pfenning and deposited in the fungal herbarium of the Universidade Federal de Lavras, assigned as CML 292. The strain Phomopsis cassiae was subculture in Petri plates containing Potato Dextrose Agar (PDA) and incubated during seven days. After this period, it was inoculated at 25-28 °C in 28 Erlenmeyer flasks of 500 mL, each containing 200 mL of Potato Dextrose Broth (PDB). The cultures were incubated at 25 ºC and aerated by agitation on an orbital shaker at 150 rpm for 28 days. Extraction of the filtered fermentation broth (ca. 5.6 L) with ethyl acetate (3 x 2.4 L) provided the organic phase, that was dried with MgSO\textsubscript{4} and concentrated to yield 277.1 mg of crude extract.

**Extraction and isolation**

The crude extract (277.1 mg) was chromatographed by CC using reverse phase silica (Merck LiChroprep\textsuperscript{®} RP-18 25-40 mm; 3 x 15 cm) and eluted with H\textsubscript{2}O:MeOH (85:15) to MeOH (100%) gradient to afford 12 fractions (150 mL each, Fr-1 to Fr-12). The fraction Fr-2 (19.3 mg, H\textsubscript{2}O:MeOH - 65:35) was purified on a preparative HPLC column (RP - 18 H\textsubscript{2}O:ACN - 86:14, 10 mL min\textsuperscript{-1}), yielding 3 (3.0 mg, t\textsubscript{R} = 35 min). The fractions Fr-9 (4.0 mg, H\textsubscript{2}O:MeOH - 35:65) and Fr-12 (4.6 mg, H\textsubscript{2}O:MeOH - 75:25), were analyzed by analytical HPLC [H\textsubscript{2}O:ACN (35:5) to ACN (100%) gradient, 40 min.] yielding 1 (4.0 mg, t\textsubscript{R} = 26.3 min) and 2 (4.6 mg, t\textsubscript{R} = 31.8 min).

**Antifungal assay**

The microorganisms used in the antifungal assays C. cladosporioides (Fresen) de Vries SPG 140 and C. sphaerospermum (Penzig) SPC 491, have been maintained at the Instituto de Botânica, São Paulo, Brazil and assays were performed using direct autobiography.\textsuperscript{11,12} Nystatin was used as positive control (detection limit 1 μg).

**Cytotoxicity bioassay**

The human cervical cancer cell line (HeLa) assay was performed as previously described.\textsuperscript{13} Cisplatin was used as positive control (IC\textsubscript{50} 5.0 μmol L\textsuperscript{-1}).

**Ethyl 2,4-dihydroxy-5,6-dimethylbenzoate (1).** White solid, (R\textsubscript{f} 0.75 on SiO\textsubscript{2}-TLC [CHCl\textsubscript{3}:MeOH (9:1)]; ESI-MS, +20 eV, m/z (%) : 211 [M + H]\textsuperscript{+} (100); IR (KBr) ν\textsubscript{max}/cm\textsuperscript{-1}: 3435, 2928, 2864, 1633; 1H and 13C NMR spectra (Table 1).

**Phomopsisilactone (2).** Yellow solid, R\textsubscript{f} 0.58 on SiO\textsubscript{2}-TLC [CHCl\textsubscript{3}:MeOH (9:1)]; [α]\textsubscript{D}\textsuperscript{25} +50 (c 0.19 CHCl\textsubscript{3}); HRESIMS: m/z 249.0923 (calc. for C\textsubscript{13}H\textsubscript{12}O\textsubscript{5}, 249.0763); IR (KBr) ν\textsubscript{max}/cm\textsuperscript{-1}: 3435, 2925, 2860, 1633; 1H and 13C NMR spectra (Table 1).
